

Fact Sheet – Purlin Bridging Systems

Common Issues

- Slow and cumbersome to install.
- Order codes can be confusing with too many options.
- Flimsy channel doesn't feel strong enough and bracket ends that bend if stepped on.
- Other Hook Lock bridging systems tend to be loose when installed due to tolerances inherently in their designs, leads to rattling noises once installed.
- Ends not interchangeable easily if ordered incorrectly.
- Very hard to unhook and rectify errors once installed.

Millform Hook Fast Advantage

- Simple 3 piece patented system which makes ordering easy with simple part numbers that are descriptive.
- Fast installation, up to 50% time saving due to positive action ends and locator clips made from strong 1.90 BMT material.
- 1.20 BMT stud as the channel which makes it stronger than competition with tension strip that ensures the installation is firm and will not rattle once installed.
